NUTRITION AND IMMUNE HEALTH: CONSIDERATIONS FOR ATHLETES

Lecture content provided by GSSI, a division of PepsiCo, Inc. Any opinions or scientific interpretations expressed in this presentation are those of the author and do not necessarily reflect the position or policy of PepsiCo, Inc.
OVERVIEW

• Functions of the immune system

• Discuss dietary constituents needed for immune support

• Describe lifestyle factors associated with immune health

• Review key nutrition education concepts to best promote health and immune function
Physiological Support of Immunity

- Dietary strategies
  - Energy & protein
  - Vitamins & minerals from food
- Adequate sleep
- Limit alcohol
- Strategic supplementation

Immune Boosting

- A marketing term for supplements
- The immune system can only be “boosted” if there is a nutrient deficiency or lifestyle alternation leading to immunosuppression
## IMMUNE FUNCTION & ATHLETES

### Why infection is incompatible with success in elite sport.

- Medal winners suffer fewer and shorter URI
- Infection is the 2nd most common reason to present to a team medic, after injury
- Sickness correlates negatively with training volume
- Illness accounts for 1/3 of all lost training days
- 2/3 of illnesses result in “time loss” from training and competition; 1/3 of illnesses result in “performance restriction”
- Recent below-the-neck symptoms increases the likelihood of not finishing an endurance event
- Heavy exercise can extend an ongoing infection
- Heavy exercise during infection, or after incomplete recovery, can lead to medical emergencies ...
  - Rhabdomyolysis¹
  - Myopericarditis²
  - Exertional heat stroke
### Ten risk factors for infection in athletes.

1. Autumn and winter — common cold and flu season
2. Poor hygiene and exposure to sick people
3. Recent symptoms
4. Air travel
5. Life stress, depression and anxiety
6. Low energy availability
7. Poor sleep
8. Increases in training load, e.g., training camp
9. National vs. International level
10. Low mucosal immunity (saliva/tear immunoglobulin-A)
Protein Calorie Malnutrition
• Increases risk of infection

Severe Energy Restriction
• Increased stress hormones (cortisol)
• Impacts immunity

Most athletes don’t have a severe restriction but may have low energy.

Paradoxically, athletes with frank anorexia nervosa do not have immunosuppression unless the condition is severe.
URI illness reported by athletes during training & competition

Elite female athletes experiencing LEA (via LEAF-Q)

Risk of URI in female athletes with LEA

Identifying athletes at risk for LEA may be helpful to assess illness risk in team sports.

Restrictive eating, fasting and strict diets may be a risk factor for illness.
CARBOHYDRATE INTAKE IS RELATED TO THE IMMUNE FUNCTION OF AN ATHLETE
Exercising on a low CHO diet (<10% of calories) elevates stress hormones and may cause a fall in white blood cells.

Consuming 30-60 grams of CHO during exercise can prevent a decrease in T-lymphocytes as well as the reduction of stress hormones.

Adequate CHO is essential for proper immune function and levels of stress hormones.

Microbiota diversity

Very low CHO diets = low FIBER

No agreement on risk-benefit of CHO on commensal bacteria in the gut

Best guidance is to continue to eat whole grain, complex carbohydrate diets

(High saturated fat diets can also alter gut bacteria ratios)
**FIBER REQUIREMENTS**

- **39 g/d** for men
- **25 g/d** for women

14 g per 1000 calories

Increase gradually!

The average American only eats 10 - 13 g/d!
<table>
<thead>
<tr>

Microorganisms on/within the body:

Short chain fatty acids (SCFA) result when gut bacteria work on undigested CHO.

SCFA from high fiber have been shown to reduce the inflammation in the colon and dampen allergic airway disease.

Diets should be rich in fiber and prebiotics; the food needed for probiotic survival.
Probiotic-Containing Foods

Yogurt
Kefir
Sauerkraut (refrigerated)
Pickles (refrigerated)

Prebiotic-Containing Foods

Asparagus
Banana
Barley
Beets
Chicory
Garlic

Honey
Onion
Tomato
Rye
Soybean
Wheat

Cow’s Milk
Peas
Beans
Seaweed
Microalgae
Jerusalem Artichoke

Kimchi
Tempeh
Miso

PROBIOTIC & PREBIOTIC CONTAINING FOODS
Probiotics can bolster the gut barrier and prevent bacterial migration.

May be able to reduce the time of inflammatory response.

Supplementation may reduce the incidence of upper respiratory illness by 50% and reduce the duration, if infected by approximately 2 days.

Associated with a decreased demand for antibiotics.
In one study, four weeks of multi-species probiotic supplementation reduced markers of gut permeability and symptoms of GI discomfort during exercise-induced heat stress.

May protect the intestinal barrier and crowd out the deleterious bacteria.

Most studies use probiotics over an extended time for prevention.

The strength of evidence for the use of probiotics to support immune function is moderate/strong.

VITAMINS & MINERALS FOR IMMUNE HEALTH

Supports epithelial barrier function against pathogens and promotes the oxidant scavenging activity of the skin

Needed for the development of immune cells

Found in high concentrations in white blood cells

Levels fall significantly during a common cold

Saturating tissues requires 100-200 mg per day

During an active infection, ~1g/d may be needed with some indication for higher doses

Carr AC, Maggini S. Nutrients. 2017;9:1211-1236

Vitamin D deficiency can have a negative impact on immune health.

Moderate to strong evidence that adequate levels of vitamin D supports the immune health of athletes.

Decreased inflammatory cytokines, preserved epithelial function, increased antimicrobial peptides.

Vitamin D3 supplement 87% more effective than prescription vitamin D2

Food is a generally a poor source but better absorbed in a meal with moderate fat

No adverse effects of vitamin D supplementation reported for daily doses <10,000 IU/d

Mega doses (70,000 IU/week) have been found to increase status in athletes, but inhibit activity of the active form

Consider 10,000 IU/day for the first week then 5000 IU/day to maintain blood level between 40-60 ng/ml
Many would require supplementation to reach 40-60 ng/ml.

</tr>
</tbody>
</table>
A NOTE ON ZINC

No Scientific Support
To prevent URI

Regular high dose zinc supplementation should be avoided.

Strong Scientific Support
To treat URI

Zinc lozenges (75 mg elemental zinc/day) may reduce the duration of an URI by 3 days when taken within the first 24 hours of symptoms.

Optimal composition of zinc lozenges is yet to be determined.

Direct Immune Support from Omega-3 Fatty Acids

- Evidence for a direct role on immune function is not strong.
- May play a role in the membrane integrity of lymphocytes.
- May help maintain integrity of the intestinal barrier, rather than direct effect on immune response.

Sleep
Alcohol
Cross talk between the immune system and sleep patterning.

Fever, sickness and the mediators involved can alter patterns of sleep.

Athletes who are ill report an increase in sleepiness and fatigue that may be caused by inflammation. Restoration of energy in part is driven by a decrease in inflammation.

Conversely, sleep deprivation has been shown in most studies, but not all, to have a negative impact on immune health.

Sleep deprivation can reduce the effectiveness of vaccines indicating some suppression of the immune response.
Consequences of Short Sleep and Solutions

Disruptions in immune function.

Short sleep (< 7 hours) reduces natural killer cells by 30%.

Increasing sleep duration to 8-10 hours restores white blood cell levels.

Napping 30 minutes after sleep deprivation can also restore white blood cell levels.

Salivary cortisol, a marker of stress, is also reduced after a nap.
Studies of college student athletes consistently reveal that students involved in sports not only drink alcohol more often than non-athletes, but they are also more likely to drink to excess.

Alcohol alters the normal and desirable response of the immune system to infection via altering white blood cell function.

Increased susceptibility to illness and infection.

Decrease in anabolic hormones may alter protein synthesis, post-exercise recovery and healing.
PRACTICAL RECOMMENDATIONS REGARDING FOOD & IMMUNE HEALTH
1/2 of the plate should contain a wide variety of fruits and vegetables.

Fiber and prebiotics for gut and immune health.

Polyphenols and colors to reduce inflammation and promote good health.

1/4 of the plate should contain whole grains and/or complex carbohydrates such as potatoes, sweet potatoes, brown rice, whole wheat or higher fiber pasta.

1/3 to 1/4 of the plate should be a lean protein to include eggs, fish, chicken, beef, tofu, tempeh or beans.

A variety of foods is needed to increase nutrient diversity.
# Nutrients for Immune Health: Summary

<table>
<thead>
<tr>
<th>Nutrient</th>
<th>Amount needed</th>
<th>Best food sources</th>
<th>Mode of action</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHO</td>
<td>40-60% of total calories 30-60 g per hour during sport</td>
<td>Whole grain, fruit, cereals, oatmeal, yogurt milk During sport- sport drinks- gels</td>
<td>Reduces stress hormones, supports gut microbiome</td>
</tr>
<tr>
<td>Protein</td>
<td>0.54-0.9 grams per/lb</td>
<td>Lean meat, dairy, whey protein, beans, peas, nuts</td>
<td>Supports white blood cell formation</td>
</tr>
<tr>
<td>Vitamin D</td>
<td>2000 IU per day</td>
<td>Sunlight, salmon, trout, mushrooms, fortified cereals</td>
<td>Gene expression, upregulation of B and T lymphocytes</td>
</tr>
<tr>
<td>Vitamin C</td>
<td>200 mg for tissue saturation 1 gram + during illness</td>
<td>Oranges, peppers, broccoli,</td>
<td>Antioxidant, high concentration in WBC, scavenger of reactive oxygen species</td>
</tr>
<tr>
<td>Zinc</td>
<td>8-11 mg DRI- 75 mg elemental zinc during infection within first 24 hours</td>
<td>Oysters, red meat, breakfast cereal</td>
<td>Anti-oxidant, protein synthesis, DNA,RNA synthesis</td>
</tr>
<tr>
<td>Probiotics</td>
<td>Daily intake- supplemental during season</td>
<td>Yogurt, kimchee, refrigerated pickles, sauerkraut, supplements</td>
<td>Preservation of gut integrity, blocking pathogens</td>
</tr>
<tr>
<td>Omega 3</td>
<td>500 mg EPA/DHA minimum up to 2 grams</td>
<td>Cold water fish, nuts, chia,</td>
<td>Primarily anti-inflammatory</td>
</tr>
</tbody>
</table>
**Vitamin C**
Needed during active infection at 1 gram/d.

Tissue saturation occurs at ~ 200 mg/d and can be done with food.

**Vitamin D**
Ideally blood values would be known, should be between 40-60 ng/ml.

If the athlete is not supplementing, consider 10,000 IU for first week, followed by maintenance of 5000 IU/day.

**Omega-3 Fatty Acids**
2 grams of EPA +DHA per day.
SUMMARY VIDEO

Video Link https://www.youtube.com/watch?v=hc7eE4DSbZY
KEY TAKEAWAYS

- Maintaining a healthy immune system is important for high level athletic performance.
- The lifestyle of an athlete may increase their risk of infection. This includes, but is not limited to, low energy availability and poor sleep.
- Nutrients related to immune health include: carbohydrate, protein, Vitamins C & D, zinc and probiotics.
